Behaviour Totals

The behaviour totals widget simply displays the amount of behaviour incidents associated with a student in a table format.

The select user widget is used to select a child and this is the only widget that can be used in conjunction with the behaviour totals. There are no settings for this widget in the edit panel and it simply displays the total number of behaviour incidents logged in the previous month and then a running total of the whole year.

As you can see there is both positive and negative behaviour information in this table, giving you a quick overview on the number of total incidents.
